| 18. Resistance box                    | x2 |
| 19. End destination board             | x2 |

#### Build Steps

1. Attach the truck sides centrally to the saloon sides.

2. Produce the lower saloon box of 2 lower sides and 2 bulk heads by assembly on a flat surface in the upside-down position

3. Attach the platforms centrally under the bulkheads with the rear wide sections flush with the bottom of the bulkhead. You will need to trim the edges of the platforms so that they fit inside the body.
4. Fit a resistance box next to the bulkhead on the nearside of the platform.
5. Bend the dash panels to match the shape of the platform, trim to length so that it fits against the resistance box and fix in place.
6. If required, fit half of the under-stair gate (not supplied) above each resistance box.

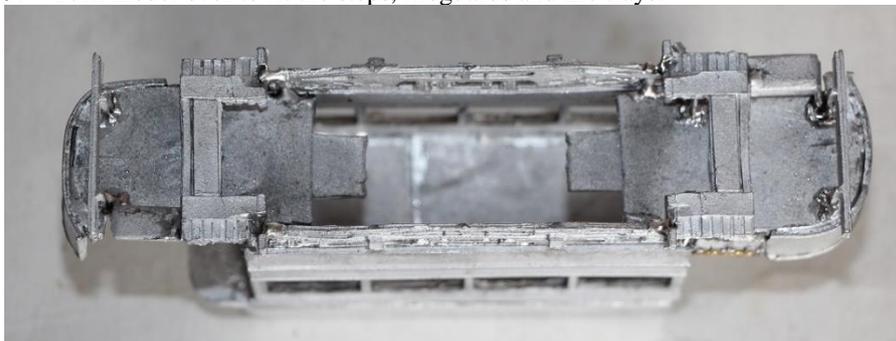

7. On a flat surface, solder the two halves of the upper floor together then fit centrally to the body.

8. If required, fit the open top sides, bending the end panels so that they run across the middle of the floor extension and then round to the top of the stairs. Trim the lower edge of the end decency panel to get a good fit to the floor.

9. Turn model over to fit the steps, lifeguards and life trays.

10. Fit the trolley mast to the left of the middle of the upper floor.
11. Fit the stairs unless you wish to paint them first.

12. Using brass wire (not supplied) with the help of prototypical photos, drill and fit handrails
